STEPSNAP GUIDE

How to Configure a Custom Domain & SSL on Vercel

A step-by-step walkthrough to connect your custom apex or subdomain to a Vercel project, configure DNS CNAME records, and verify automatic SSL certificate provisioning.

TOTAL STEPS
5 Steps

TABLE OF CONTENTS

1. Navigate to Project Settings
2. Select Domains from the Sidebar Navigation
3. Enter Custom Domain or Subdomain
4. Configure DNS Records at Your Registrar
5. Verify Configuration and Automatic SSL Certificate

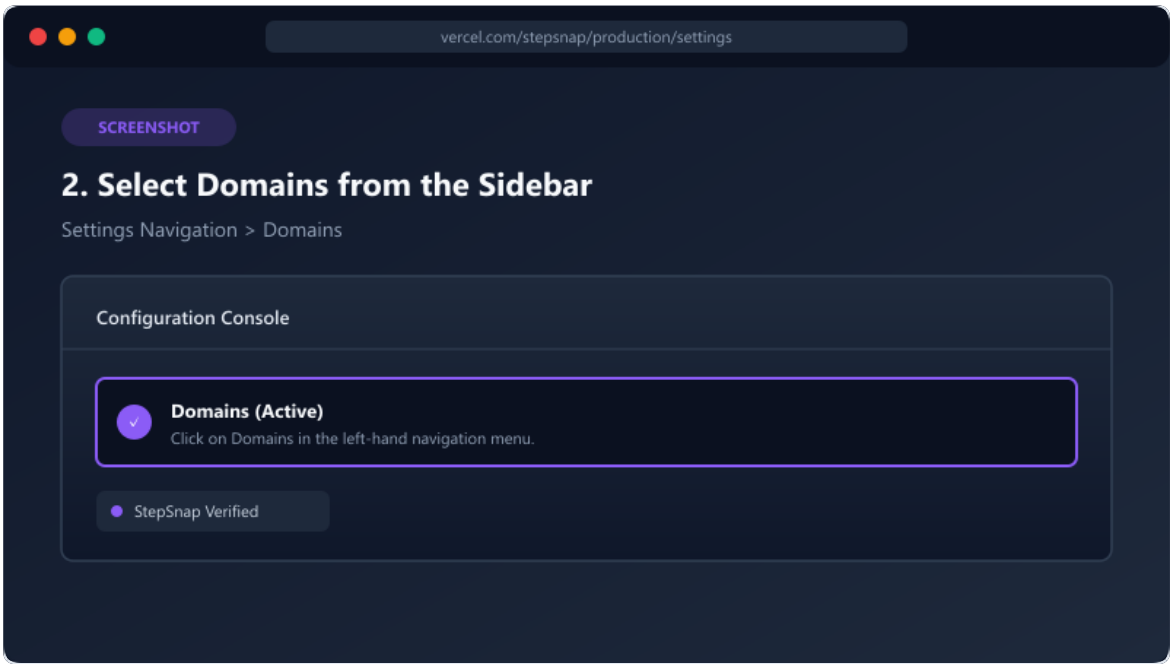

1 Navigate to Project Settings

Open your Vercel Dashboard, select your deployment project from the overview list, and click on the "Settings" tab in the top navigation bar to access environment and routing parameters.

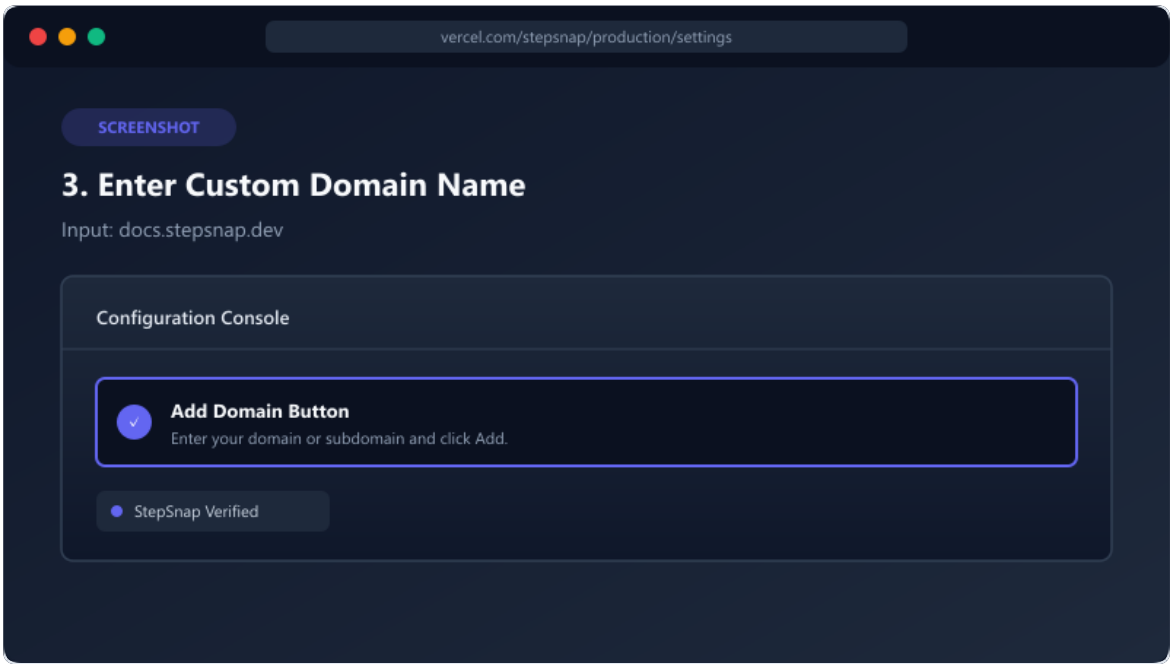

2 Select Domains from the Sidebar Navigation

In the left-hand navigation sidebar, locate and click on "Domains". This section displays all currently assigned production and preview domains along with their DNS validation status.

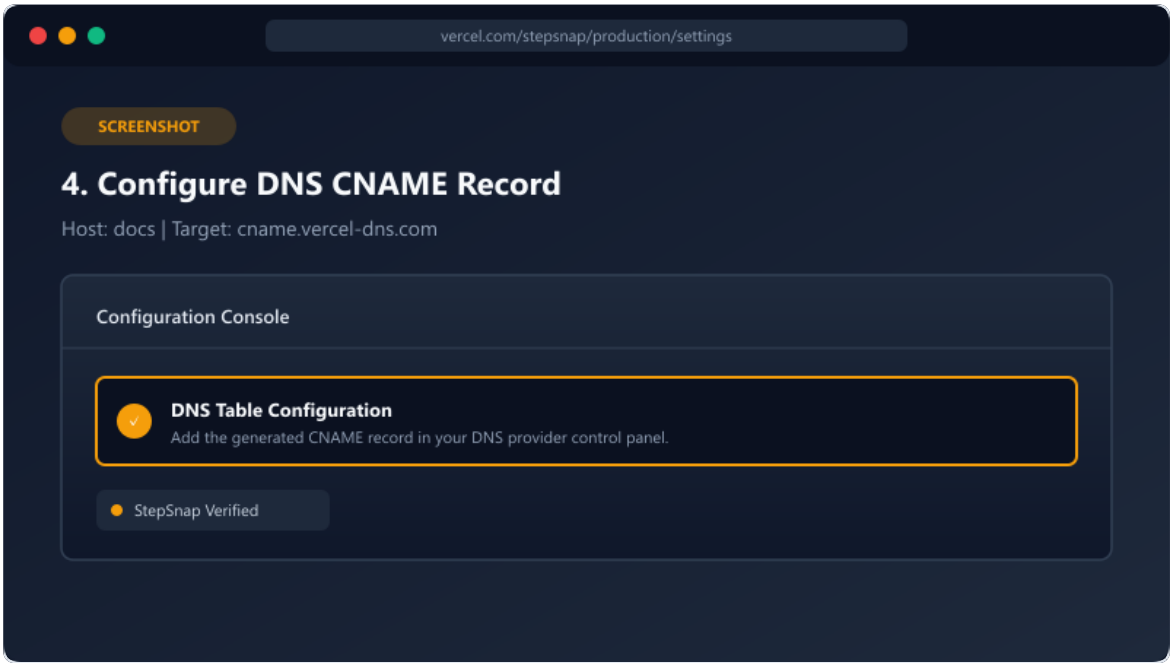

3 Enter Custom Domain or Subdomain

In the input field under "Add Domain", type your target hostname (e.g., docs.stepsnap.dev or app.your-domain.com). Choose the production branch to route traffic to, and click the "Add" button.

4 Configure DNS Records at Your Registrar

Vercel will detect whether DNS records are active. For subdomains, add a CNAME record with Host "docs" pointing to "cname.vercel-dns.com". For apex domains, configure an A record pointing to "76.76.21.21". Set TTL to 300 seconds.

5 Verify Configuration and Automatic SSL Certificate

Allow 1-2 minutes for DNS propagation. Once Vercel detects the record, it automatically provisions and installs a Let's Encrypt SSL/TLS certificate. The status badge will turn green showing "Valid Configuration".
